

The Rotahead punch from I Holland Ltd

A unique solution to localised punch head wear delivering the following benefits to keyed punches:

Reduced Punch Head Wear

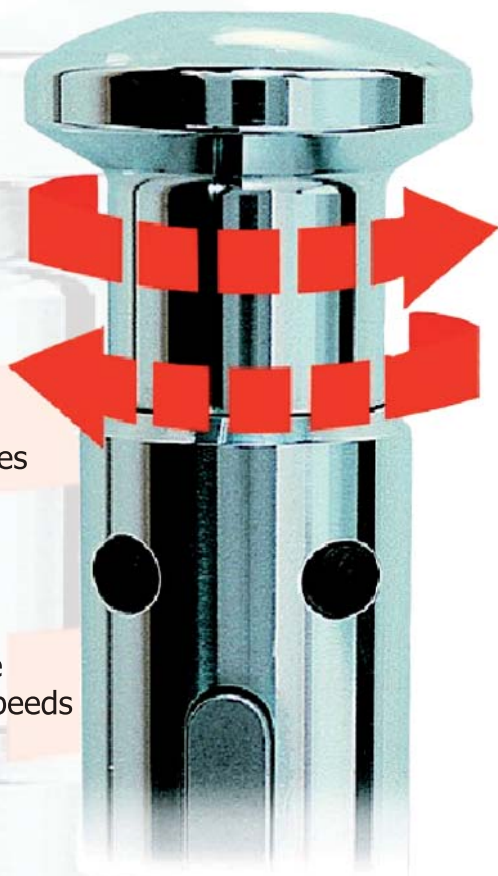

Rotahead punches allow the head to rotate independently to the punch body, providing a 'bearing' between the punch head and cams. The punch head can be manufactured from a harder, more wear resistant material optimising metallurgical characteristics of the punch assembly, and providing extended tooling life.

Cleaner, Smoother Operation

Rotahead punches only require one key position which eliminates contamination of a secondary keyway or slot, giving a cleaner, smoother operation in the press and producing quality tablets.

Faster and Quieter Operation

Rotahead punch heads rotate on the cams, giving less 'resistive force' which enables the tablet press to be operated at faster speeds and therefore allowing for a higher tablet output.

The **Rotahead** concept can be applied to most standard punch types, both upper and lower, including Euro B, Euro D, Pharma, 20/28, 25/32 and EU1" - 441.
